Sbamlisong:

Comprehensive Report on the Creation, Structure, and Operation of a Balisong:

This report provides a detailed description of the project for creating a Balisong, or butterfly knife, constructed entirely from scratch using scrap metal, long metal pieces, and a specially drilled latch. The report will discuss the materials and tools employed to assemble the various components of the Balisong, as well as the process of calibration and locking to ensure proper functionality. Additionally, an overview of the functioning, structure, and appropriate usage of the Balisong will be provided.

The Balisong was constructed using scrap metal and four long metal pieces. To facilitate the opening and closing motion, a system of bolts, washers, and hexagonal nuts were utilized, connecting the different parts of the knife and allowing for smooth blade movement. The latch was specifically drilled to ensure stability and safety during usage.

Following the assembly of the Balisong's components, precise calibration is necessary to ensure the proper functioning of the butterfly knife. Once the Balisong achieves the desired tension and smoothness in its opening and closing, it is locked at the bolt level using hot glue. This procedure helps maintain the adjustments and stability of the entire instrument.

The Balisong consists of several essential components that enable its correct and safe operation. One of these components is a survival-focused blade, which may include serrations, an integrated harpoon that breaks upon impact, and a sharpened edge utilizing a piece of scissors. The Balisong's blade possesses significant cutting power and durability, making it suitable for survival activities.

Proper usage of the Balisong requires a comprehensive understanding of its structure. The butterfly knife comprises a handle and two oval-shaped blades that pivot and open and close around a central hinge. Executing the opening and closing motion requires coordination and a secure grip on the Balisong. During use, it is crucial to always keep the latch securely fastened to prevent accidental blade deployment.

The project to create a Balisong from scrap metal has been successfully executed, utilizing a drilled latch, bolts, washers, and hexagonal nuts to connect the various components. Precise calibration of the knife has been accomplished to ensure smooth and safe operation. To use the Balisong properly, a deep understanding of its structure and coordination during the blade's opening and closing motion is necessary. It is worth noting that the Balisong's blade, with its serrations and sharpened edge, is especially well-suited for survival activities or extreme self-defense situations.
